

Blue IoT (integration of transportation) is the first of its kind platform. It was developed to visualize data used to create efficient and safer roadways, while managing sensors and additional equipment as assets for a self-contained maintenance and traffic management software system. The application offers an open API for easy integration and provides for quick development of technologies and hardware.

Transportation Asset Maintenance (TAM) is an important and complicated part of the ITS and Traffic industry. The Federal Highway Administration provides a coordinated approach to managing infrastructure assets such as ITS field devices, traffic signal equipment and telecommunications systems over the course of their life-cycle. Let FAMS simplify your approach to asset management and maintenance.
